Here are the topics that will be covered in the Chemistry section of the UIL Science Exams. The most notable change from 2013 to 2014 is the dropping of nuclear chemistry in the list.

1. Fundamentals
   Measurements, fundamental SI units, metric prefixes, unit conversions, classification of matter, the mole, concentration terms, isotopes, accuracy vs precision, extensive vs intensive properties, physical vs chemical properties.

2. Stoichiometry
   **Composition:** chemical formulas, empirical formula, formula units, molar mass, percent composition, nomenclature, ionic compounds, covalent compounds, first 10 hydrocarbons (alkanes), grams to moles and vice versa.

   **Reaction:** types of chemical reactions, balancing reactions, predicting amounts of products, limiting reactant, percent yield

   Tie-ins to other topics: calculating moles from pressure/volume of gases, calculating concentrations of solutions in percent by mass, molarity, molality, ppm, ppb, and mole fraction.

3. Atomic Theory
   Parts of the atom. Relative size of atoms. Electromagnetic radiation, frequency, wavelength, energy of one or more photons, Planck’s constant. Photoelectric effect, work function of a metal. Quantum theory, line-spectra (emission and absorption), energy levels within the atom (Rydberg equation). Quantum numbers and the rules for each of them. The relative size and shapes of the atomic orbitals of hydrogen. Aufbau principle, Hund’s rule, Pauli exclusion principle. Writing electron configurations for atoms and monatomic ions.

   Periodic Table: names of groups 1A, 2A, 7A, and 8A (or 1, 2, 17, and 18), trends of physical and chemical properties of the elements. Ionization energy, electron affinity, electronegativity, atomic radii, ionic radii, metallic character.
4 - Chemical Bonding and Structure

5 - Gases

6 - Liquids and Solids

7 - Thermodynamics

8 - Physical Equilibria
Enthalpies (heats) of transition (fusion, vaporization, sublimation, condensation,…). Entropy of these changes. Free energy change during these transitions. Phase diagrams.

Colligative properties: vapor pressure lowering (Raoult’s Law), freezing point depression, boiling point elevation, and osmotic pressure. The van’t Hoft factor (\(i\)) – how it relates to strong electrolytes and weak electrolytes.
9 - Chemical Equilibria
The equilibrium constant, $K$. Using $K$. $K_c$ and $K_p$. The form of $K_c$. The reaction quotient, $Q$. LeChatlier’s Principle – predicting rxn direction of reactions under a set of conditions, stressing a reaction and predicting change. $\Delta G$ vs $K$. Heterogeneous equilibria.

10 - Acids and Bases
Strong vs weak acids and bases. The definition and use of pH. Ionization constants for weak acids ($K_a$) and bases ($K_b$). Calculating pH.

Buffer solutions: defining a buffer, common ion effect, calculating pH of a buffer solution, LeChatlier’s and buffers (response to acid or base additions).

Titrations: calculating the pH during a titration (strong or weak acids and bases), pH at the equivalence point. Indicators: how they work, determining the color of an indicator and its use as an end point for titrations.

11 - Solubility Equilibria
Determining molar solubility from $K_{sp}$ and vice versa. Calculating concentrations of species for solubility equilibria. Common ion effect for solubility. Other conc terms like ppm.

12 - Electrochemistry
Identifying redox reactions. Balancing redox reactions in acid or base solution.

Definitions: anode, cathode, voltaic cell, electrolytic cell, electric current, electrolytic current, the faraday constant, oxidation, reduction, oxidizing agent, reducing agent, salt bridge, standard electrode potential ($E$), volts, standard cell potential, non-standard cell potential (use Nernst equation).

Batteries: primary vs secondary vs fuel cells. Know the fundamentals of a lead storage battery (aka: a car battery).
13 - Chemical Kinetics
Defining the rate of a reaction. Units for rxn rates. Writing the reaction rate law equation. The specific rate constant and its units. Reaction order. Using tabulated data and using the Method of Initial Rates to determine the rate law for a reaction. The integrated rate laws for zero, first, and second order reactions. Half-life and its calculation.

Reaction mechanisms: writing elementary steps for a reaction. Writing rate laws for elementary steps. Importance of the rate-limiting step. Potential energy diagrams for kinetic reactions (aka reaction profile) - interpreting activation energy of the forward and reverse reactions. Multi-step reaction schemes.

Temperature effects on the rate (Arrhenius equation). How catalysts work and their effect on reaction rates - and how it changes the potential energy diagram.

Approximate Question Distribution/Difficulty for Each Exam

Invitational A & B
Topics 1-11 (no 12 or 13) with emphasis on 1 and 2. Generally these 2 exams will have the easiest types of questions. Very straight forward information and calculations.

District 1 & 2
All topics are possible (1-13) here. The questions will go a little deeper into the subject matter. Some problems will be complex in nature but overall, this is a notch down in difficulty from the regional and state exams.

Regional and State
Once again, all topics will be covered (1-13). Any problems from 1 and 2 will be more complex than on previous exams - often a multi-step solution. All other topics will be at a more advanced level. Equilibrium problems will require more algebra to solve them. Of course the state exam will be the hardest of all the exams. Most of the calculations on the state exam will require a few calculation steps and not just one.
